

CLIMATE CHANGE AND SUSTAINABILITY

What we do

Climate resilience mapping and assessments

Climate and social risk assessment

Climate and sustainability policy advice

Science-policy linkages

Impact assessment

Monitoring and evaluation

Organisational development

Strategic planning

Project management

Capacity building

Climate modeling

The future devastating impacts of climate change are well established. These changes bring economic, social and ecological pressures that threaten global populations, particularly the world's most disadvantaged and vulnerable populations.

To understand the risks to communities and to implement appropriate action requires evidence-based approaches that reflect the context and resilience of that community.

Preparing for these impacts requires a comprehensive response strategy that includes building resilience and adaptive capacity. This demands a coordinated and holistic approach at local, regional, and national levels, in urban and rural settings.

Our Capability

Sustineo helps clients address the social and economic factors associated with sustainability and climate change issues. This ranges from climate adaptation and mitigation activities through to rural and agricultural development.

We design innovative and integrative approaches to help communities understand, mitigate and adapt to the on-going threat of climate change. This draws on a systematic and holistic approach that recognises that sustainability measures are an integral part of policy development, not distinct from other policy drivers.

Using tailored methods we work and collaborate with government agencies, community groups, and other stakeholders to reveal problems and knowledge gaps, customise interventions, identify barriers, and develop customised long-term

sustainability strategies.

Sustineo's consultants provide technical advisory and research services to Australia and the Asia-Pacific region. We specialise in mixed-method research drawing on quantitative and qualitative techniques, monitoring and evaluation, community development and climate risk assessments.

This bespoke and specialist approach ensures that programme, policy and regulatory interventions, along with related governance structures and processes, are relevant and aligned to our client's individual context.

Feature Project

Development and application of an evidence-based climate change adaptation toolkit | Asia Pacific Network

Our consultants, in association with project partners, assess the climate change impacts on vulnerable communities in the Ramgarh Basin, India. The project applied a climate adaptation toolkit, derived from evidence-based tools, to inform policy and planning processes. This helped formulate adaptive response plans sensitive to the local context while building the capacity of policymakers, planners and researchers.
